

“ I keep more trucks busy on the road using AssetWorks, and I can keep trucks loaded both ways. I can plan the entire day to maintain efficient operations and service my customers in real-time.”

— Lee Plant, General Manager,  
Rick's Oilfield Hauling

### Mobile Workforce Management Made Easy

AssetWorks Field Service Solution is a complete vehicle tracking, field ticketing, and mobile workforce management system that improves the efficiency of fleet-based business. It delivers Automatic Vehicle Location (AVL/GPS), field ticketing, driver behavior monitoring, work alone safety, driver logs, reporting and maintenance capabilities.

### ROI You Can Count On

- More efficient dispatching
- Improved remote worker safety and better driving behaviors
- Reduced data entry
- Lower fuel costs
- Improved response times to customer calls and better customer service
- Better vehicle maintenance
- Lower staffing requirements
- Improved communications between office staff and field operators

# Field Service Solution

## Lower Operating Costs and Increase Efficiency

Deployed in the cloud, AssetWorks Field Service Solution can be implemented quickly and tailored to fit every fleet's needs and budget.

### Vehicle and Asset Tracking

Vehicle tracking allows office staff to monitor the location of all the vehicles in the fleet on a real-time map. Valuable assets such as trailers, expensive tools, and yellow iron can also be tracked to allow the closest available asset or vehicle to be routed to a job site, minimizing downtime and the need to rent equipment.

### Fleet Monitoring and Maintenance

Powerful driver behavior monitoring dashboards provide fleet managers with a transparent view of operations. Monitor speed, fuel consumption and RPMs to address high fuel costs and safety issues caused by excessive speed or unnecessary idling. Vehicle pre-trip inspection and maintenance reminders, based on odometer readings, ensure valuable vehicles are maintained appropriately.

### Fleet Reporting

The Field Service Solution provides managers with a comprehensive set of reports for enhanced operational insight. Managers can choose from pre-made reports or create their own.

### Field Ticketing

Field operators electronically fill in field tickets and job statuses are tracked automatically. Office staff are able to send last-minute changes directly to the operator and ticketing information is received at the office electronically in real-time, eliminating paperwork and time-consuming data entry. All the information captured is time-stamped and accurate allowing for immediate billing.

### Work-Along Safety

The work-alone safety option allows easy compliance with lone worker legislation and safety policies by automating the check-in process, ensuring field operators are connected to the office at all times. Workers can check in on their mobile device or with an intrinsically-safe work-alone pendant. In the office, staff can monitor the status of all lone workers and are immediately alerted when a worker misses a check-in or an emergency arises.

### Electronic Driver Logs and Hours of Service (HOS)

The optional Hours-of-Service (HOS) module provides functionality to make legislative compliance effortless and straightforward. Combining in-vehicle Electronic Logging Devices (ELDs) and in-office software, the solution handles all North American regulations including north of 60° and 49th Parallel rule changes, allows multiple crew login on the same vehicle and supports pre-trip and post-trip inspections.

## Integrated Technologies

### Technology in the Vehicle

#### ■ In-Vehicle Monitoring System (IVMS)

One platform supports tracking all asset types with a range of devices to meet varying needs—from sophisticated mobile computing, and tablet and smartphone apps, to driver behavior monitoring and basic trailer tracking.

#### ■ Integration

The Field Service Solution integrates with third-party software systems to allow for real-time data use across all areas of an organization. AssetWorks partners with each of our clients to ensure the software integration matches their specific use of these external applications.
