The Three Little Pigs

Which of the houses built by the three little pigs is most likely to get blown over if the big bad wolf huffs and puffs? (circle one)

Straw

Wood

Brick

The Three Little Pigs

If you answered the straw house, you are correct! The materials used to build the straw house are not as strong as the materials used to build the wood and brick houses. So when a big gust of wind comes, it's more likely to blow over.

Did you know that everyone who owns a house, pays money to a company called an insurance agency? They do this so that if something happens to their house and they need to fix it up, the insurance agency can help them pay to get it fixed.

Convective Storms

A convective storm is a fancy name for a very strong thunderstorm. Other types of convective storms are tornadoes and hailstorms. Can you draw a picture of a convective storm? If you're drawing a thunderstorm – don't forget the clouds, rain, and lightning!

First Name: _____ Age: _____

What is Risk Management?

In risk management, it's important to think about what could go wrong and then take actions that help make those things less likely to happen.

Have you ever jumped on a trampoline? When we did, we were always told that we had to take turns. That only one person could be jumping at a time. That's risk management. The less kids that jump on the trampoline at the same time the less likely someone will get hurt.

Let's check your risk management skills! Which of these things would help make it safer for you to cross the street? Put a "✓" by the ones that make it safer to cross the street and an "X" by the ones that don't.

_____ Holding a Parent's Hand

_____ Running Fast without Looking

_____ Crossing in a Cross Walk

_____ Looking Both Ways

_____ Waiting for the Walk Sign

The Three Little Pigs

Building a house out of a strong material like bricks instead of straw is risk management. It makes it less likely that the big bad wolf will be able to "huff and puff and blow the house down."

Math and Risk Management

Math is *really* important in risk management. It's all about trying to figure out the likelihood that a specific event will happen. Let's look at some examples:

The Three Little Pigs 

Will the house blow down?

More Likely	Less Likely
The straw house	The brick house

Jumping on a Trampoline 

Will any kids get hurt?

More Likely	Less Likely
Lots of kids jumping	One kid jumping

Let's flip a coin!

A coin has two sides – heads and tails. If you flip a coin, it will land with either the heads side up or the tails side up. Since there are two sides, the likelihood of getting heads is 1 in 2. The likelihood of getting tails is

1 in 2. That means it's VERY unlikely that you can flip a coin 10 times and get heads EVERY time. Ask the person you went to work with today to flip a coin 10 times. Each time, color in one of the gray circle below with a heads symbol or a tails symbol.

How many of each did you get? Heads = _____ Tails = _____

Take your Child to Work Day 2020

Draw a picture of you and the person you got to go to work with or work from home with today. With a job in risk management, that person plays a very important role in helping to make the world safer for everyone!
